

# Daniel Marie Fungi

There are many different types, shapes and colours of fungi and so many exciting things about them. If you want to find some fungi visit Lambert Gully, Mt Nelson, Tasmania.

Fungi aren't plants or animals so what are they? They belong to a group called non-greens. Fungi also don't have roots so if you're holding a plant like thing it's fungi. They start off as spores then turn into fungi and toadstools. The Fly Agarics have a red cap with white spots. They can grow to 20cm at the most. When they are young their caps are a perfectly round cap but as they get older their caps curve upwards. The Fly Agarics stalk can get very thick. Fungi are found in damp dark places.
